

Annual Drinking Water Quality Report Plaza, North Dakota 2022

We are very pleased to provide you with this year's *Annual Drinking Water Quality Report*. We want to keep you informed about the excellent water and services we have delivered to you over the past year. Our goal is to provide you with a safe and dependable supply of drinking water. Our water source is supplied by North Prairie RWD System III.

The City of Plaza is participating in North Dakota's Wellhead Protection Program. Copies of the Wellhead Protection Program plan and other relevant information regarding this program can be obtained from the City Auditor during normal office hours. The North Dakota Department of Environmental Quality has prepared a Source Water Assessment for Plaza. Information on this program is available at the Auditors office.

Our public water system, in cooperation with the North Dakota Department of Environmental Quality, has completed the delineation and contaminant/land use inventory elements of the North Dakota Source Water Protection Program. Based on the information from these elements, The North Dakota Department of Environmental Quality has determined that our source water is "*not likely susceptible*" to potential contaminants. No significant sources of contamination have been identified.

This report shows our water quality and what it means. If you have any questions about this report or concerning your water utility, please contact Terry Reese at 701-497-3359. We want our valued customers to be informed about their water utility. If you want to learn more, please attend any of our regularly scheduled meetings. They are held on the 1st Monday of every month in the Plaza Hall Meeting Room, starting at 8:00 PM. If you are aware of non-English speaking individuals who need help with the appropriate language translation, please call Terry at the number listed above.

The City of Plaza would appreciate it if large volume water customers would please post copies of this *Annual Drinking Water Quality Report* in conspicuous locations or distribute them to tenants, residents, patients, students, and/or employees, so individuals who consume the water, but do not receive a water bill can learn about our water system.

The City of Plaza routinely monitors contaminants in your drinking water according to Federal and State laws. The following table shows the results of our monitoring for the period of January 1st to December 31st, 2022. As authorized and approved by EPA, the state has reduced monitoring requirements for certain contaminants to less often than once per year because the concentrations of these contaminants are not expected to vary significantly from year to year. Some of our data, though representative, is more than one-year-old.

The sources of drinking water (both tap and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land, or through the ground, it dissolves naturally occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity.

Contaminants that may be present in source water include:

Microbial contaminants, such as viruses and bacteria, may come from sewage treatment plants, septic systems, agricultural livestock operations and wildlife.

Inorganic contaminants, such as salts and metals, can naturally occur or result from urban storm water, industrial or domestic wastewater discharges, oil production, mining, or farming.

Pesticides and herbicides, which come from a variety of sources such as agriculture, urban storm water runoff and residential uses.

Organic chemical contaminants, including synthetic and volatile organic chemicals, are by-products of industrial processes and petroleum production, and can, also, come from gas stations, urban storm water runoff and septic systems.

Radioactive contaminants, which can be naturally occurring or be the result of oil and gas production and mining activities.

In order to ensure that tap water is safe to drink, the Environmental Protection Agency (EPA) prescribes regulations which limit the number of certain contaminants in water provided by public water systems.

The Food and Drug Administration (FDA) regulations establish limits for contaminants in bottled water which must provide the same protection for public health.

In the following table you will find many terms and abbreviations you might not be familiar with. To help you better understand these terms we have provided the following definitions.

Not applicable (NA), No Detect (ND)

Parts per million (ppm) or Milligrams per liter (mg/l) - one part per million corresponds to one minute in two years or a single penny in \$10,000.

Parts per billion (ppb) or Micrograms per liter (µg/l) - one part per billion corresponds to one minute in 2,000 years, or a single penny in \$10,000,000.

Picocuries per liter (pCi/l) –Pico curies per liter is a measure of the radioactivity in water.

Action Level (AL) - the concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow.

Treatment Technique (TT) - A treatment technique is a required process intended to reduce the level of a contaminant in drinking water.

Maximum Contaminant Level - The “Maximum Allowed” (MCL) is the highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.

Maximum Contaminant Level Goal - The “Goal” (MCLG) is the level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.

Maximum Residual Disinfectant Level (MRDL) – The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.

Maximum Residual Disinfectant Level Goal (MRDLG) – The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

2022 Test Results for the city of Plaza & North Prairie RWD System III								
<u>Contaminant</u>	<u>MCLG</u>	<u>MCL</u>	<u>Level Detected</u>	<u>Units</u>	<u>Range</u>	<u>Date (year)</u>	<u>Violation Yes/No Other Info</u>	<u>Likely Source of Contamination</u>
Lead/Copper								
Copper	1.3	AL=1.3	0.83 90 th % Value	ppm	N/A	2020	(0) sites exceeded AL	Corrosion of household plumbing systems; erosion of natural deposits; leaching from wood preservatives
Lead*	0	AL=15	1.7 90 th % Value	ppb	N/A	2020	(0) sites exceeded AL	Corrosion of household plumbing systems, erosion of natural deposits
Disinfectants								
Chloramines	MRDL G=4	MRDL =4.0	0.9	ppm	0.0 to 0.48	2022	No	Water additive used to control. Microbes.
Inorganic Contaminants								
Nitrate-Nitrite	10	10	0.13	ppm	N/A	2022	No	Runoff from fertilizer use; leaching from septic tanks, sewage; erosion of natural deposits
Stage 2 Disinfection By-Products (System-Wide)								
HAA5	N/A	60	6	ppb	N/A	2022	No	By-product of drinking water chlorination
TTHM	N/A	80	8	ppb	N/A	2022	No	By-product of drinking water chlorination

Bacteriological Monitoring Data-RTCR: Total Coli Form Data: October had the highest number of Total Coli Form Samples. **Total Coli Form Positives for that month: (1)** Coli forms are bacteria that are naturally present in the environment and are used as an indicator that other potentially harmful bacteria may be present.

Violation: Disinfection By-products Rule -Failure to Monitor/Report (Major) 4th quarter of 2022. This rule requires us to monitor monthly chlorine levels when bacteriological samples are collected and report them to the Department of Environmental Quality on a quarterly basis. A routine bacteriological sample collected during the month of October 2022 was positive for Total coliform. Repeat samples were then required and were collected for the City of Plaza; however, the samples were not collected at sites within our distribution system, as required by the Safe Drinking Water Act. Subsequently, these samples were invalidated. Because the samples were incorrectly submitted and had to be rejected, a quarterly disinfectant residual report could not be submitted at the end of the Oct-Nov-Dec 2022 quarter, and we received a violation. We are unsure of the level of disinfectant during that time. Some people who use water containing chlorine greater than the MRDL could experience irritating effects to their eyes and nose. Some people who drink water containing chlorine greater than the MRDL could experience stomach discomfort. The City of Plaza has taken steps to correct this violation of the Disinfectants and Disinfection By-products Rule by returning to a routine monitoring and reporting schedule. EPA requires monitoring of over 80 drinking water contaminants. Those contaminants listed in the table above are the only contaminants detected in your drinking water.

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that the water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the Environmental Protection Agency's Safe Drinking Water Hotline (1-800-426-4791)

*If present, elevated levels of lead can cause serious health problems, especially for pregnant. Women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. The City of Plaza is responsible for providing high quality drinking water but cannot control the variety of materials used in plumbing components. **Use water from the cold tap for drinking and cooking. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking.** If you are concerned about lead in your drinking water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at <http://www.epa.gov/safewater/lead>.

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons, such as, persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by cryptosporidium and other microbiological contaminants are available from the Safe Drinking Water Hotline (1-800-426-4791).

Please call our office if you have any questions.
